Question: Find the sum to n terms of series ,
whose n^{th} term is : $n(n+1)(n+4)$.

Solution

Parameter	Description	Value
$x(n)$	n^{th} term of series	$n(n+1)(n+4)u(n)$
$y(n)$	sum of n terms of series	

TABLE 0: Given parameters

From equation (??) to (??),

$$X(z) = \frac{z^{-1}(1 + 4z^{-1} + z^{-2})}{(1 - z^{-1})^4} + \frac{5z^{-1}(z^{-1} + 1)}{(1 - z^{-1})^3} + \frac{4z^{-1}}{(1 - z^{-1})^2} \quad (1)$$

$$Y(z) = X(z)U(z) \quad (2)$$

$$= \frac{z^{-1}(1 + 4z^{-1} + z^{-2})}{(1 - z^{-1})^5} + \frac{5z^{-1}(z^{-1} + 1)}{(1 - z^{-1})^4} + \frac{4z^{-1}}{(1 - z^{-1})^3} \quad (3)$$

$$= \frac{z^{-1}(1 + 11z^{-1} + 11z^{-2} + z^{-3})}{4(1 - z^{-1})^5} + \frac{13z^{-1}(1 + 4z^{-1} + z^{-2})}{6(1 - z^{-1})^4} + \frac{19z^{-1}(1 + z^{-1})}{4(1 - z^{-1})^3} + \frac{17z^{-1}}{6(1 - z^{-1})^2} \quad (4)$$

Taking reverse z transform,

$$y(n) = \left(\frac{n^4}{4} + \frac{13n^3}{6} + \frac{19n^2}{4} + \frac{17n}{6} \right) u(n) \quad (5)$$

$$= \left(\frac{n^2(n+1)^2}{4} + \frac{5n(n+1)(2n+1)}{6} + \frac{4n(n+1)}{2} \right) u(n) \quad (6)$$
